MAG Tank™ is a modular, aboveground storage tank that provides operators with a customizable footprint and multiple capacities.

MAG Tank's design features a modular approach with standardized panels. Containment capacities start at 10,000 barrels with designs that exceed 100,000 barrels. Multiple heating options are available.

MAG Tank™ employs reusable, portable and sturdy steel panel wall units that enable quick assembly and disassembly. A disposable, impermeable liner and geotextile substrate provide water containment and a puncture-resistant ground covering. After site preparation, a MAG Tank™ is typically installed in one to two days.

For operators looking to reduce costs, minimize truck traffic, increase safety, improve logistics, and reduce environmental impact, the MAG Tank™ system complements Fountain Quail's Total Water Management Solutions®. Services include treating for reuse and surface discharge, disposal, storage, hauling, and water sourcing and transfer.

Purchase and rental options available. Unlimited design and capacity configurations available with engineering approval.
